

Objects and Classes

Classes

- Classes are used to create objects
- ArrayList and HashMap are classes that are used to create objects
- How can we create our own classes that create objects?

```
ArrayList<Integer> arr1 = new ArrayList<>(Arrays.asList(10, 9, 8, 7));
```

Creating Our Own Classes and Objects

Classes

Let's create a Player class with 3 variables:

- Maximum hit points
- Current hit points
- Name

Player Class

```
public class Player {  
    private int maxHP;  
    private int hp;  
    private String name;  
  
    public Player(String name, int maxHP) {  
        this.maxHP = maxHP;  
        this.hp = maxHP;  
        this.name = name;  
    }  
}
```

- We create the Player class
- A class is a container for:
 - State - Variables that are stored in objects of this class
 - Behavior - All of the methods that can be called on that object

Player Class

```
public class Player {  
    private int maxHP;  
    private int hp;  
    private String name;  
  
    public Player(String name, int maxHP) {  
        this.maxHP = maxHP;  
        this.hp = maxHP;  
        this.name = name;  
    }  
}
```

- We'll declare variables outside of all the methods of the class
- These are called "instance variables"
- Also called "state variables", "fields", "object variables"
- A copy of these variables will be created for each object of type Player

Player Class

```
public class Player {  
    private int maxHP;  
    private int hp;  
    private String name;  
  
    public Player(String name, int maxHP) {  
        this.maxHP = maxHP;  
        this.hp = maxHP;  
        this.name = name;  
    }  
}
```

- We'll write a special method called a constructor
- The name of this method must be the name of the class
- No return type is specified

Player Class

```
public class Player {  
    private int maxHP;  
    private int hp;  
    private String name;  
  
    public Player(String name, int maxHP) {  
        this.maxHP = maxHP;  
        this.hp = maxHP;  
        this.name = name;  
    }  
}
```

- The constructor is the method that's called when we create a new Player object
- We create Player objects
 - `new Player("name", 10);`
- This constructor initializes our 3 instance variables

Player Class

```
public class Player {  
    private int maxHP;  
    private int hp;  
    private String name;  
  
    public Player(String name, int maxHP) {  
        this.maxHP = maxHP;  
        this.hp = maxHP;  
        this.name = name;  
    }  
}
```

- The keyword "this" stores a reference to the object that called a method
- The object that's being constructed when a constructor is called

Player Class

```
public class Player {  
    private int maxHP = 10;  
    private int hp = 10;  
    private String name;  
  
    public Player(String name) {  
        this.name = name;  
    }  
}
```

- You can also initialize instance variables when they are declared
- Use this if you want every object to have the same initial value for a variable

Player Class

```
public class Player {  
    private int maxHP;  
    private int hp;  
    private String name;  
  
    public Player(String name, int maxHP) {  
        this.maxHP = maxHP;  
        this.hp = maxHP;  
        this.name = name;  
    }  
}
```

- Our instance variables are all private
- Very common in Java
- Leverage encapsulation
 - Hide the details of your code
 - Expose public methods for others to interact with your code
- So how does anyone use this state?...

Player Class

```
public class Player {
    private int maxHP;
    private int hp;
    private String name;

    public Player(String name, int maxHP) {
        this.maxHP = maxHP;
        this.hp = maxHP;
        this.name = name;
    }

    public int getMaxHP() {
        return this.maxHP;
    }
    public void setMaxHP(int maxHP) {
        this.maxHP = maxHP;
    }

    public int getHP() {
        return this.hp;
    }
    public void setHP(int hp) {
        this.hp = hp;
    }

    public String getName() {
        return this.name;
    }
    public void setName(String name) {
        this.name = name;
    }
}
```

- Getters and Setters!
- Write public methods that allow access to your state
- Getters - Return the value of the requested variable
- Setters - Takes a value and reassigned the instance variable

Player Class

```
public class Player {
    private int maxHP;
    private int hp;
    private String name;

    public Player(String name, int maxHP) {
        this.maxHP = maxHP;
        this.hp = maxHP;
        this.name = name;
    }

    public int getMaxHP() {
        return this.maxHP;
    }
    public void setMaxHP(int maxHP) {
        this.maxHP = maxHP;
    }

    public int getHP() {
        return this.hp;
    }
    public void setHP(int hp) {
        if (hp <= this.maxHP) {
            this.hp = hp;
        } else {
            this.hp = this.maxHP;
        }
    }

    public String getName() {
        return this.name;
    }
    public void setName(String name) {
        this.name = name;
    }
}
```

- Why???
- It would be easier to just make our variables public!
- Control.
 - If we want to sanitize values, add code to the setter
 - If you want to format output, add code to the getter
- If others write code to access your variables directly, you do not have this option!

Player Class

```
public class Player {
    private int maxHP;
    private int hp;
    private String name;

    public Player(String name, int maxHP) {
        this.setMaxHP(maxHP);
        this.setHP(maxHP);
        this.setName(name);
    }

    public int getMaxHP() {
        return this.maxHP;
    }
    public void setMaxHP(int maxHP) {
        this.maxHP = maxHP;
    }

    public int getHP() {
        return this.hp;
    }
    public void setHP(int hp) {
        if (hp <= this.maxHP) {
            this.hp = hp;
        } else {
            this.hp = this.maxHP;
        }
    }

    public String getName() {
        return this.name;
    }
    public void setName(String name) {
        this.name = name;
    }
}
```

- You can call your setters in your constructor
- Ensures your checks are ran when an object is created

Player Class

```
public class Player {
    private int maxHP;
    private int hp;
    private String name;

    public Player(String name, int maxHP) {
        this.setMaxHP(maxHP);
        this.setHP(maxHP);
        this.setName(name);
    }

    public int getMaxHP() {
        return this.maxHP;
    }
    public void setMaxHP(int maxHP) {
        this.maxHP = maxHP;
    }

    public int getHP() {
        return this.hp;
    }
    public void setHP(int hp) {
        if (hp <= this.maxHP) {
            this.hp = hp;
        } else {
            this.hp = this.maxHP;
        }
    }

    public String getName() {
        return this.name;
    }
    public void setName(String name) {
        this.name = name;
    }
}
```

- Notice that nothing in this class is static
- Use static if a method/variable should belong to the *class*
- Do not use static if a method/variable should belong to an *object* created from the class

Player Class

```
public class Player {
    private int maxHP;
    private int hp;
    private String name;

    public Player(String name, int maxHP) {
        this.setMaxHP(maxHP);
        this.setHP(maxHP);
        this.setName(name);
    }

    public int getMaxHP() {
        return this.maxHP;
    }
    public void setMaxHP(int maxHP) {
        this.maxHP = maxHP;
    }

    public int getHP() {
        return this.hp;
    }
    public void setHP(int hp) {
        if (hp <= this.maxHP) {
            this.hp = hp;
        } else {
            this.hp = this.maxHP;
        }
    }

    public String getName() {
        return this.name;
    }
    public void setName(String name) {
        this.name = name;
    }
}
```

- Classes define new **types**
 - The `ArrayList` *class* defines the `ArrayList` *type*
 - Our `Player` *class* defines the `Player` *type*
- We can use `Player` wherever we could use any other type
 - As variable types
 - As parameter types in methods
 - As the return type of methods
 - As type parameters of data structures

Stack Memory

- Only primitive types are stored directly on the stack as values
 - double
 - int
 - char
 - boolean
 - String*
 - Double/Integer/Character/Boolean*
- **Everything else** is stored on the heap with only their references stored on the stack**
 - This includes **every** object created from a class that **you wrote**

*Strings and boxed types are actually more complex, but we will treat them as though they are on the stack in this course because they *behave* exactly as a value on the stack

**Stack and heap allocations vary by compiler and JVM implementations. With modern optimizations, we can never be sure where our values will be stored
We'll use this simplified view so we can move on and learn Computer Science

in/out

- Our constructor calls a setter method
- Methods contain a reference to the calling object in **this**

```

public class Player {
    private int maxHP;
    private int hp;
    private String name;

    public Player(String name, int maxHP) {
        this.setMaxHP(maxHP);
        this.setHP(maxHP);
        this.setName(name);
    }

    public void setMaxHP(int maxHP) {
        this.maxHP = maxHP;
    }

    public void setHP(int hp) {
        if (hp <= this.maxHP) {
            this.hp = hp;
        } else {
            this.hp = this.maxHP;
        }
    }

    public String getName() {
        return this.name;
    }

    public void setName(String name) {
        this.name = name;
    }

    public static void main(String[] args) {
        Player p1 = new Player("Dark Cecil", 10);
        Player p2 = new Player("Kain", 14);
        Player p3 = p1;
        p1.setName("Paladin");
        System.out.println(p3.getName());
    }
}

```

Stack

in/out

- This method was called by **this** in the Player constructor stack frame which stores the reference 0x999
- 0x999 is the object that called setMaxHP so that stack frame's **this** stores 0x999

```

public class Player {
    private int maxHP;
    private int hp;
    private String name;

    public Player(String name, int maxHP) {
        this.setMaxHP(maxHP);
        this.setHP(maxHP);
        this.setName(name);
    }

    public void setMaxHP(int maxHP) {
        this.maxHP = maxHP;
    }

    public void setHP(int hp) {
        if (hp <= this.maxHP) {
            this.hp = hp;
        } else {
            this.hp = this.maxHP;
        }
    }

    public String getName() {
        return this.name;
    }

    public void setName(String name) {
        this.name = name;
    }

    public static void main(String[] args) {
        Player p1 = new Player("Dark Cecil", 10);
        Player p2 = new Player("Kain", 14);
        Player p3 = p1;
        p1.setName("Paladin");
        System.out.println(p3.getName());
    }
}

```

in/out

- The setter method changes the value of a variable stored in the heap
- Follow the reference stored in **this** and set its maxHP variable

```

public class Player {
    private int maxHP;
    private int hp;
    private String name;

    public Player(String name, int maxHP) {
        this.setMaxHP(maxHP);
        this.setHP(maxHP);
        this.setName(name);
    }

    public void setMaxHP(int maxHP) {
        this.maxHP = maxHP;
    }

    public void setHP(int hp) {
        if (hp <= this.maxHP) {
            this.hp = hp;
        } else {
            this.hp = this.maxHP;
        }
    }

    public String getName() {
        return this.name;
    }

    public void setName(String name) {
        this.name = name;
    }

    public static void main(String[] args) {
        Player p1 = new Player("Dark Cecil", 10);
        Player p2 = new Player("Kain", 14);
        Player p3 = p1;
        p1.setName("Paladin");
        System.out.println(p3.getName());
    }
}

```

Stack

Name	Value
Player	
this	0x999
name	"Dark Cecil"
maxHP	10
setMaxHP	
this	0x999

	0x999

in/out

Notation Note:

- I'll gray out a stack frame that is removed from the stack
- This will have the same meaning as crossing it out
- Makes the variables readable

```

public class Player {
    private int maxHP;
    private int hp;
    private String name;

    public Player(String name, int maxHP) {
        this.setMaxHP(maxHP);
        this.setHP(maxHP);
        this.setName(name);
    }

    public void setMaxHP(int maxHP) {
        this.maxHP = maxHP;
    }
    public void setHP(int hp) {
        if (hp <= this.maxHP) {
            this.hp = hp;
        } else {
            this.hp = this.maxHP;
        }
    }

    public String getName() {
        return this.name;
    }
    public void setName(String name) {
        this.name = name;
    }

    public static void main(String[] args) {
        Player p1 = new Player("Dark Cecil", 10);
